5. Hydraulic Unit
6. Cross Rail
7. Horizontal Grinding Head
8. Universal Grinding Head
9. Pendant Control Box
10. Electrical Equipment
11. Magnetic Coolant Separator

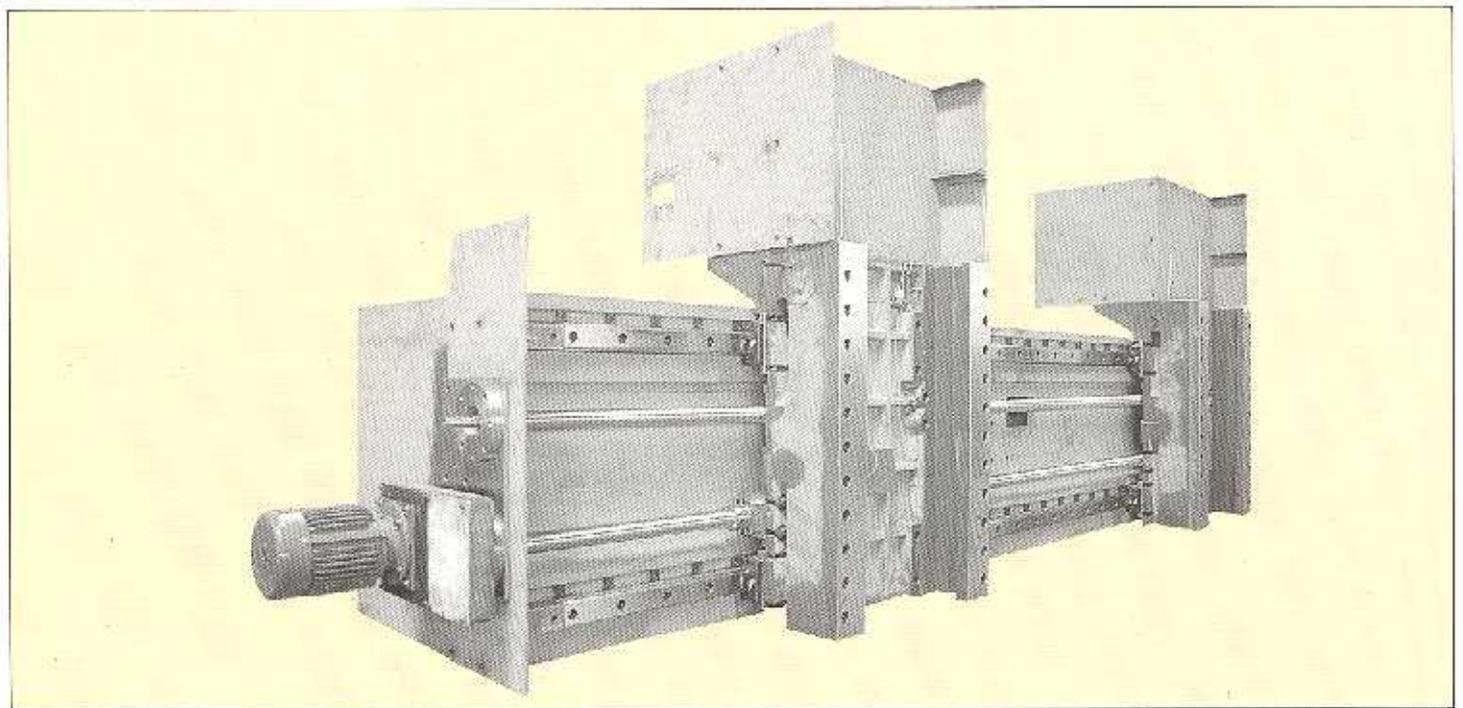

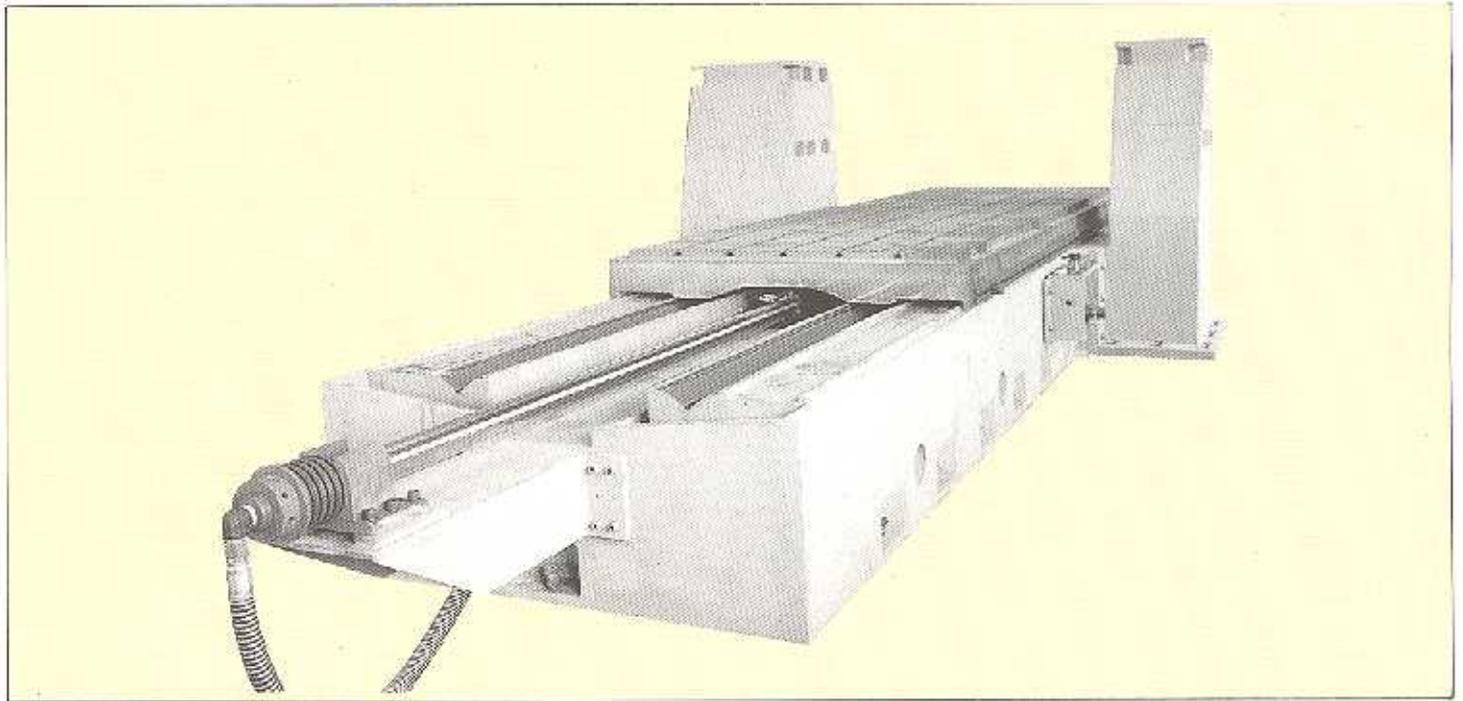

Designation Of Model Number

MACHINERY

BED AND MACHINE FRAME

1. Bed
2. Column (right)
3. Column (left)
4. Cross Rail
5. Levelling Blocks

- Base and two columns are made of high rigidly cast iron, have completely internal stress eliminated by complete tempering. This strong and antivibrated structure ensures steady and durability of the machine.
- Two "V" base slide rails had been operated with precise grinding or scrape. Length of the base is twice as long as maximum table traverse, so that table can be kept in straight running any time.
- Two columns are firmly fixed at two sides of the base. They are tightly connected with bolts and square pins. Thus, beam, columns, and base form a strong square to assure the grinding accuracy.
- Lateral beam has high intensity structure, well machined by precision grinder and joins with precision linear bearing slide ways (for two heads type). Or use high rigid cast iron which is treated with high frequency tempering and precise grinding, meanwhile, compensating with precision column type bearings (for single head type). Cross movement is driven through ball screw, very smooth and steady.

Levelling Wedges

- The base bolts influence the accuracy of the big precision machine. They are perfectly designed for the machine itself. In order to get the steady machining of the machine, readjust the level of all base bolts before set up the machine.

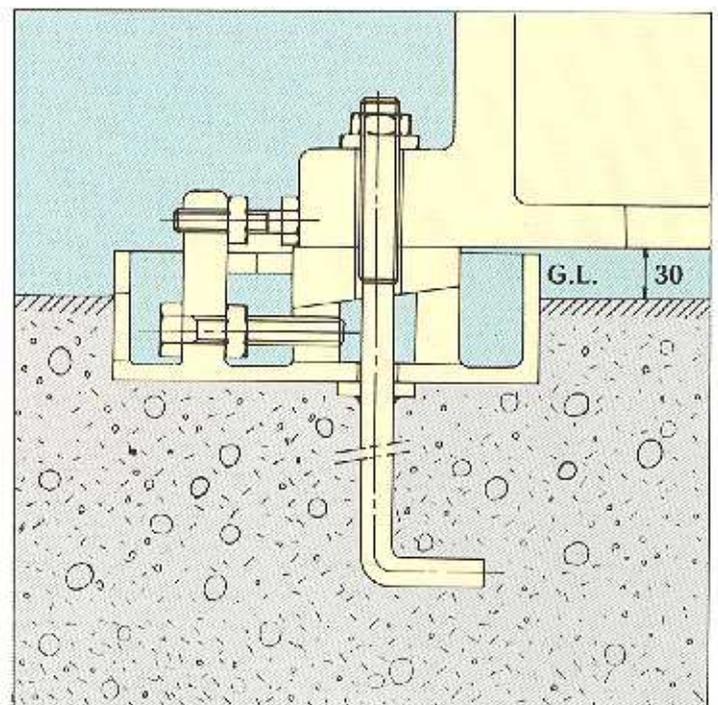

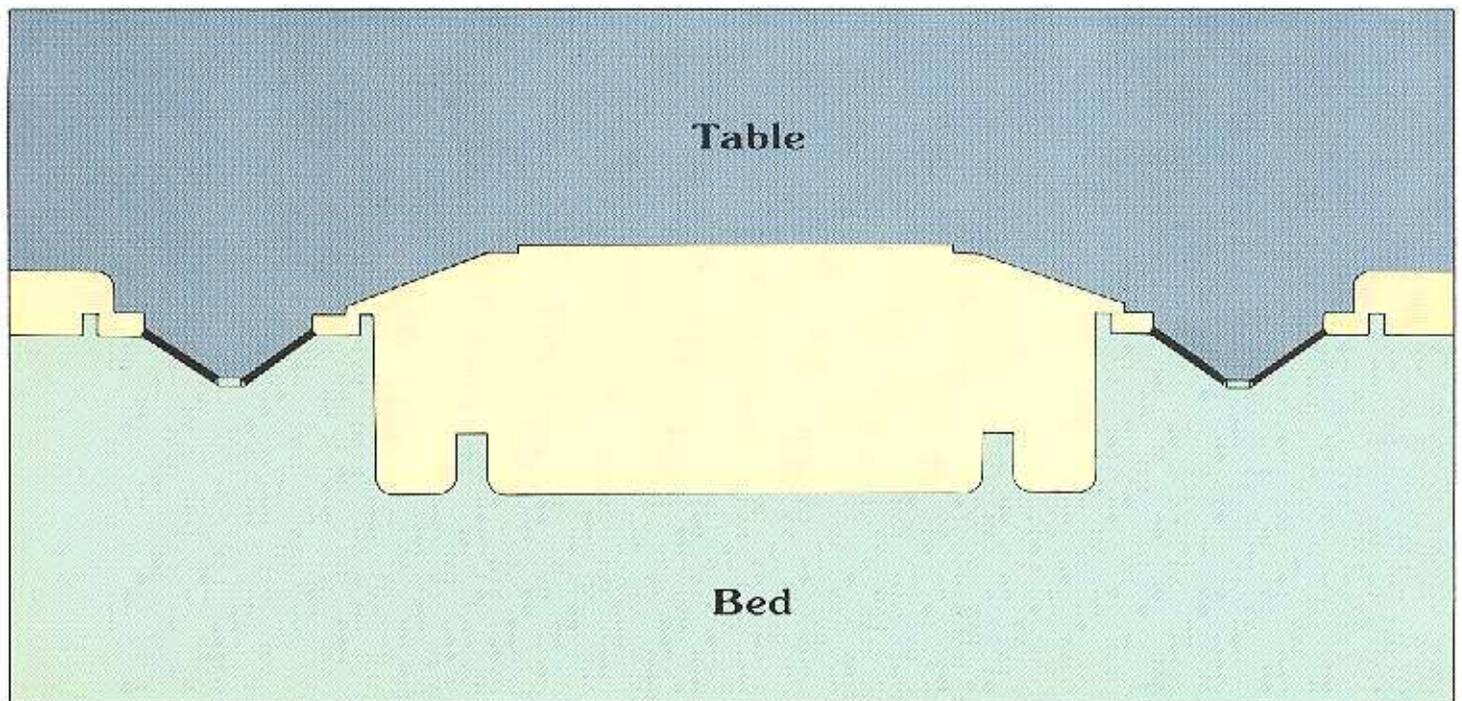

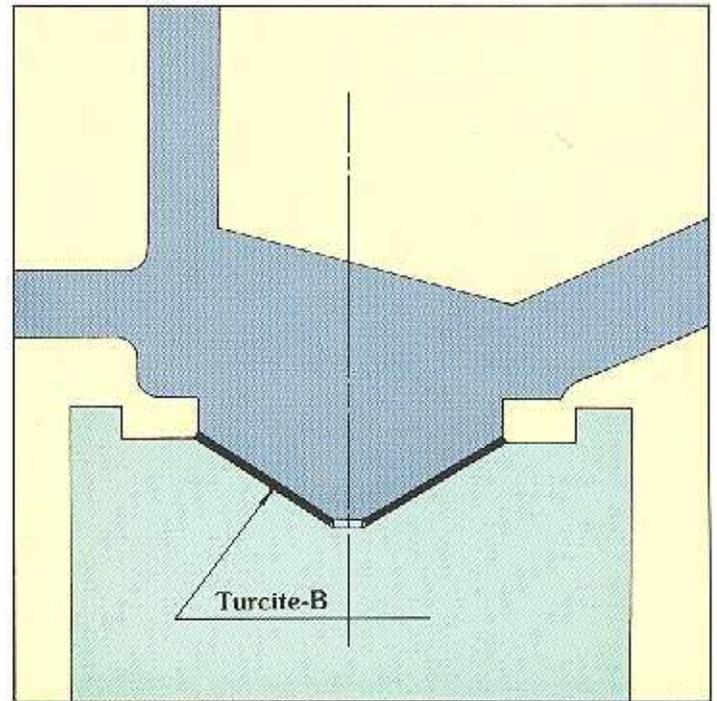

TABLE WAYS

- Two "V" slide rails of table are coated with TURCITE-B, and have a forced lubricant from automatic circulatory lubricant system. These ensure the smooth and steady grinding.
- Table is driven by a specially designed hydraulic system and cylinder for steady longitudinal movement. It can prevent pulsation, increase working efficiency and grinding quality.

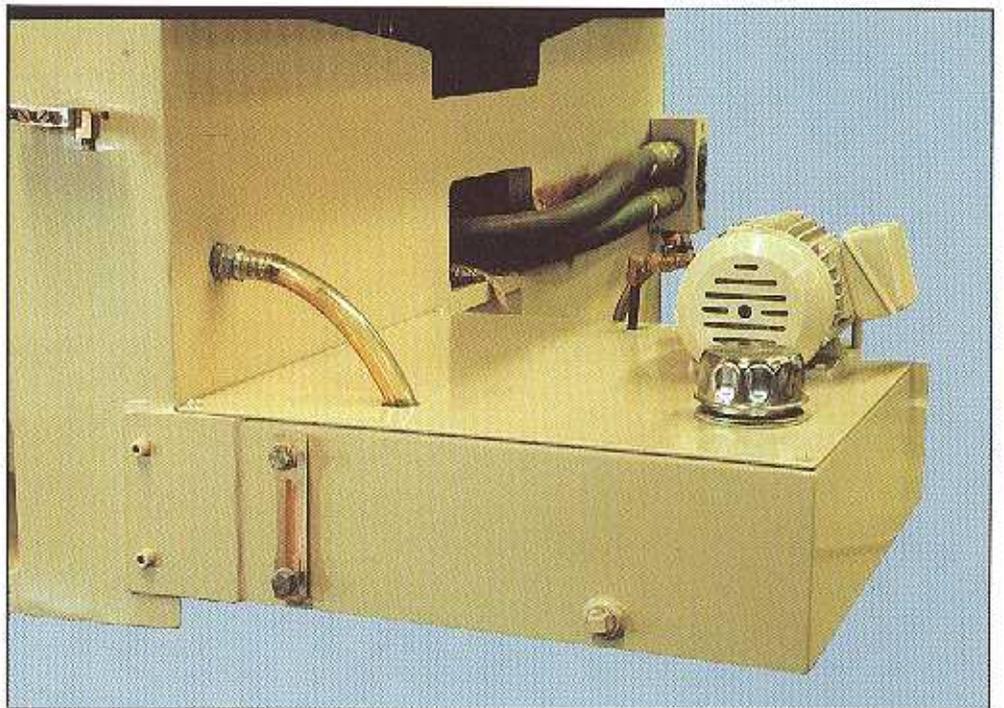

BEDWAY LUBRICATION

- Lubricant of table and base is forced lubricant system. Lubricant goes through oil grooves from top to bottom completely for firm and smooth sliding.

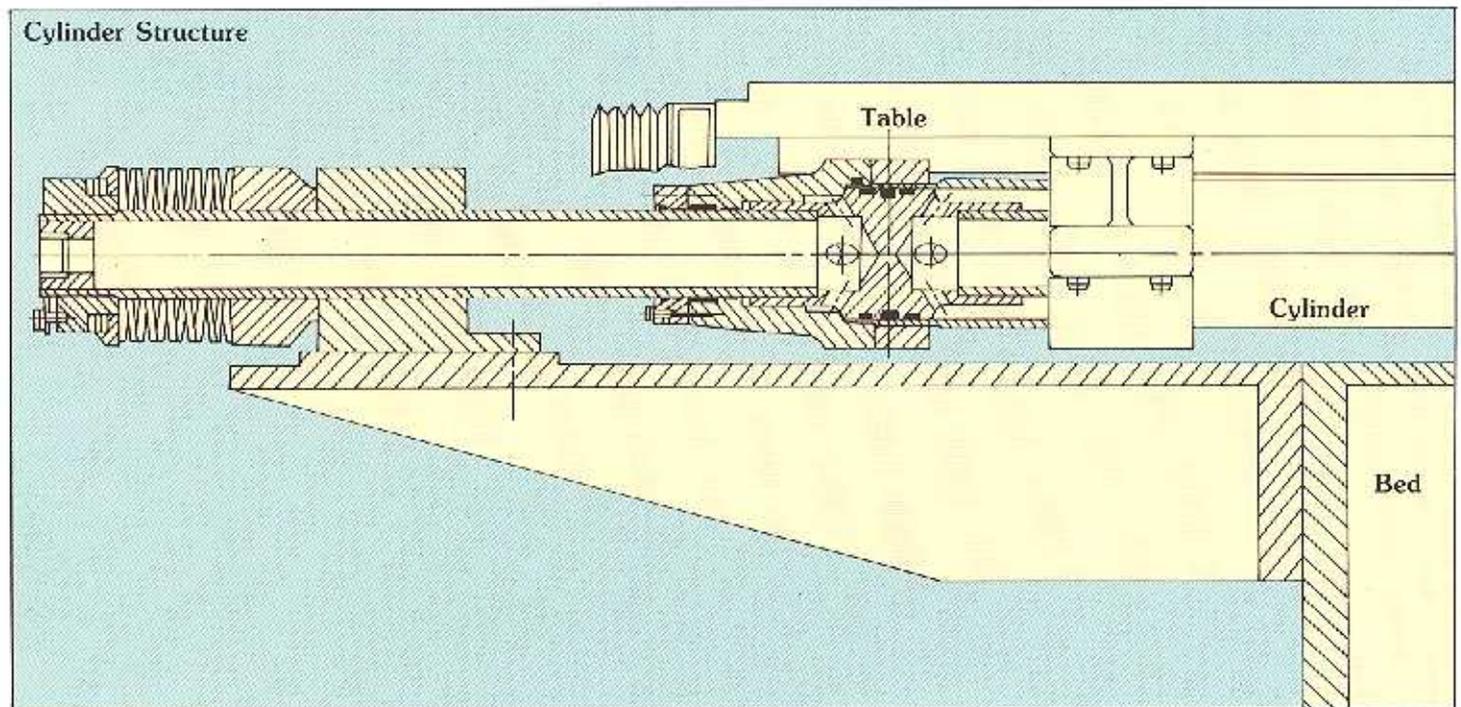

Lubricant Unit

- The lubricant tank is designed automatic circulatory system. It has flow rate adjusting valve, can offer suitable lubrication to the machine.

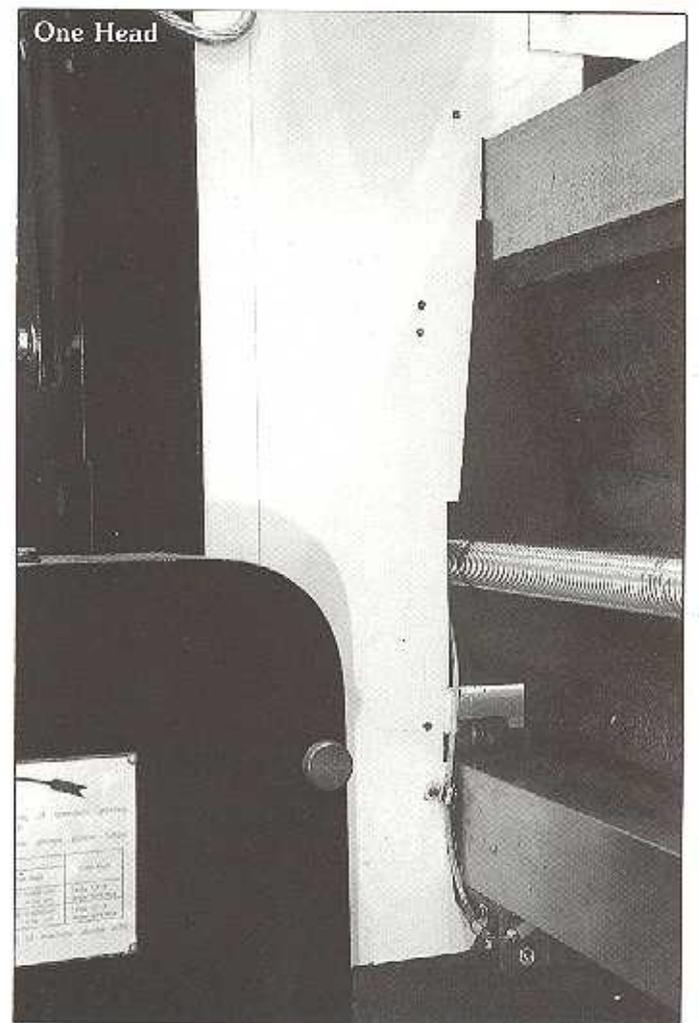

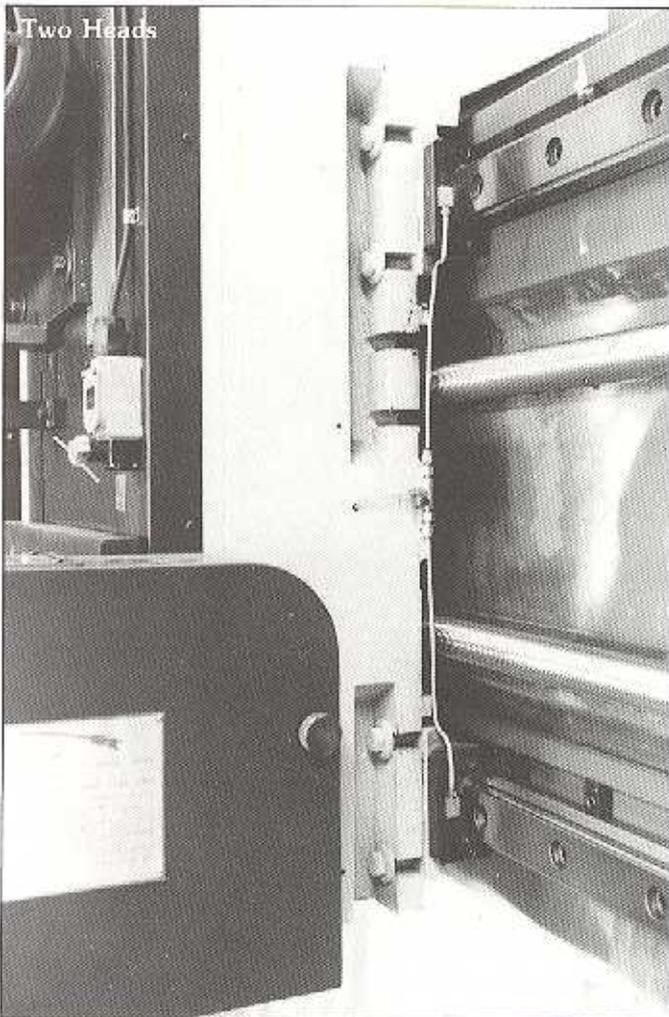

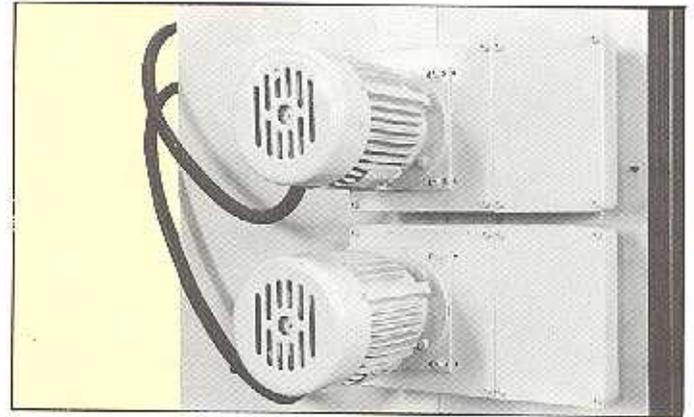

HYDRAULIC UNIT CYLINDER

- Hydraulic tank uses independent fan forced cooler to control oil in standard temperature. Meanwhile, hydraulic pressure can be adjusted per the weight of work piece.

CROSS RAIL

- There are two kinds of rail for lateral beam: one is linear bearing rail for two heads type, the precision rail makes sliding more lightly and smoothly; the other is steel rail for single head type, it has been treated with high frequency tempering to hardness HRC 59°, this ensures the precision and durable grinding.
- Power transmission of two heads type grinder: one is from common motor, belt, longitudinal ball screw to drive the spindle; the other is from servo motor, longitudinal ball screw to drive the spindle.

MACHINERY

HORIZONTAL GRINDING HEAD

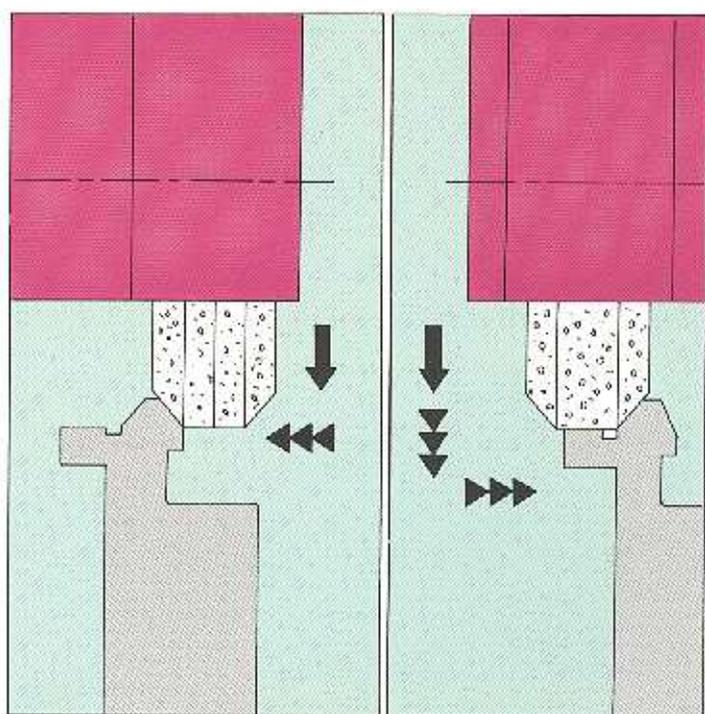

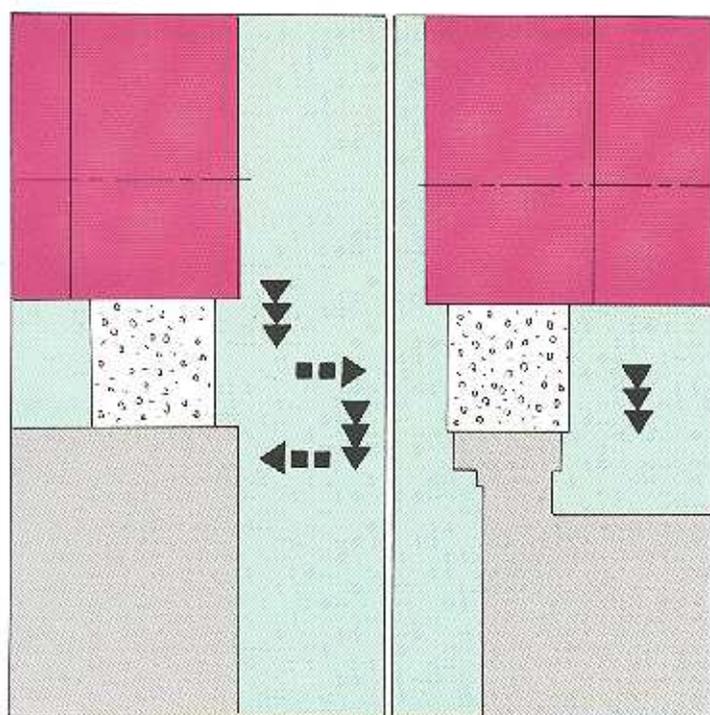

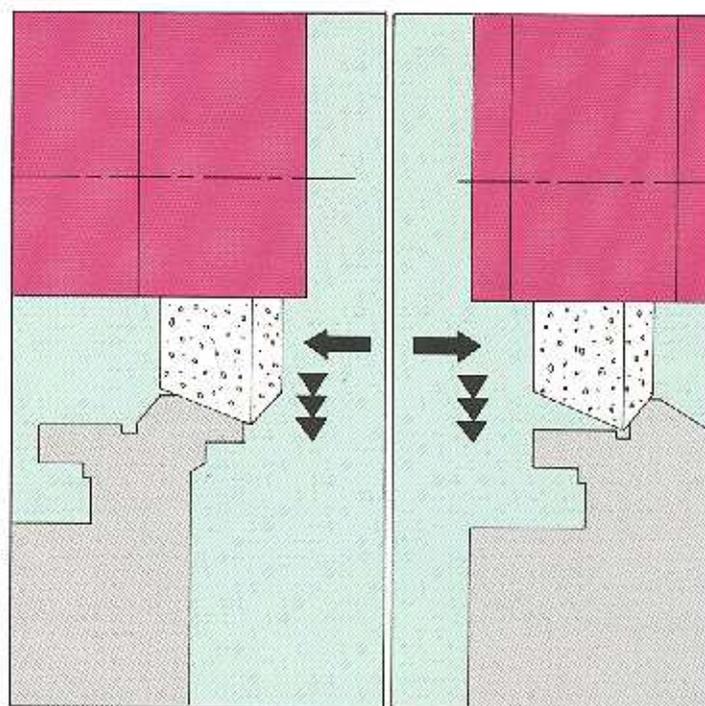

Horizontal Wheel Head

Operation Example Of Horizontal Grinding Head

Operation of horizontal axle grinding wheel can cooperate with special wheel dressers to make surface, slot, and different kinds of forming grinding easily.

- ← Rapid wheel head displacement
- ▣ Automatic stepping cross feed
- ▢ Automatic pulse feed

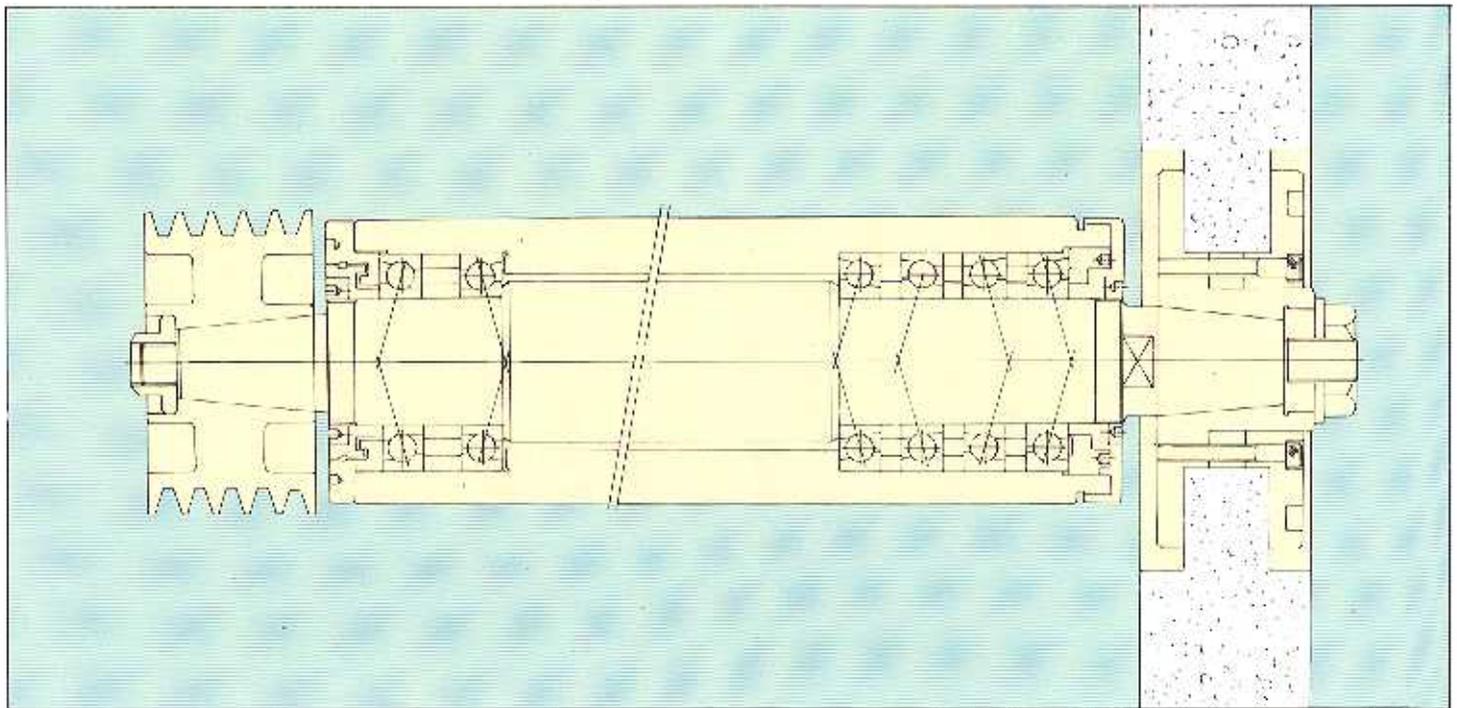

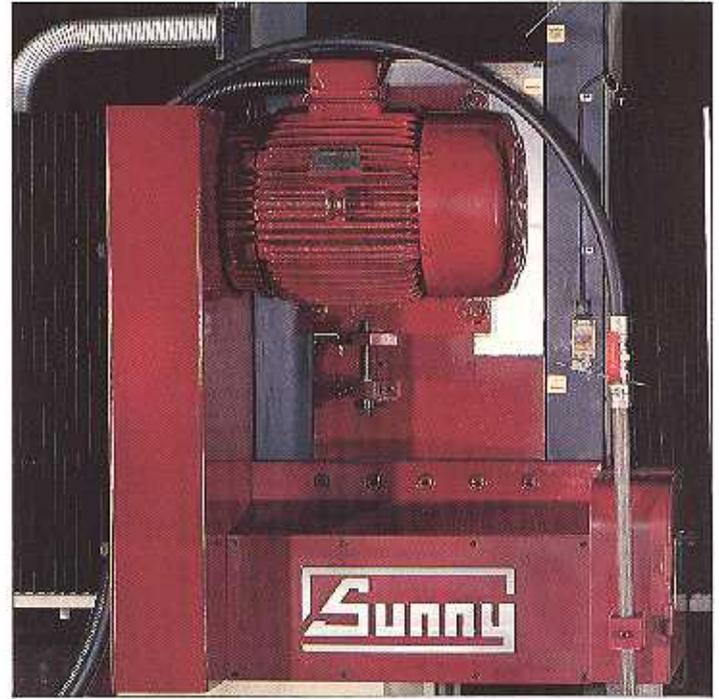

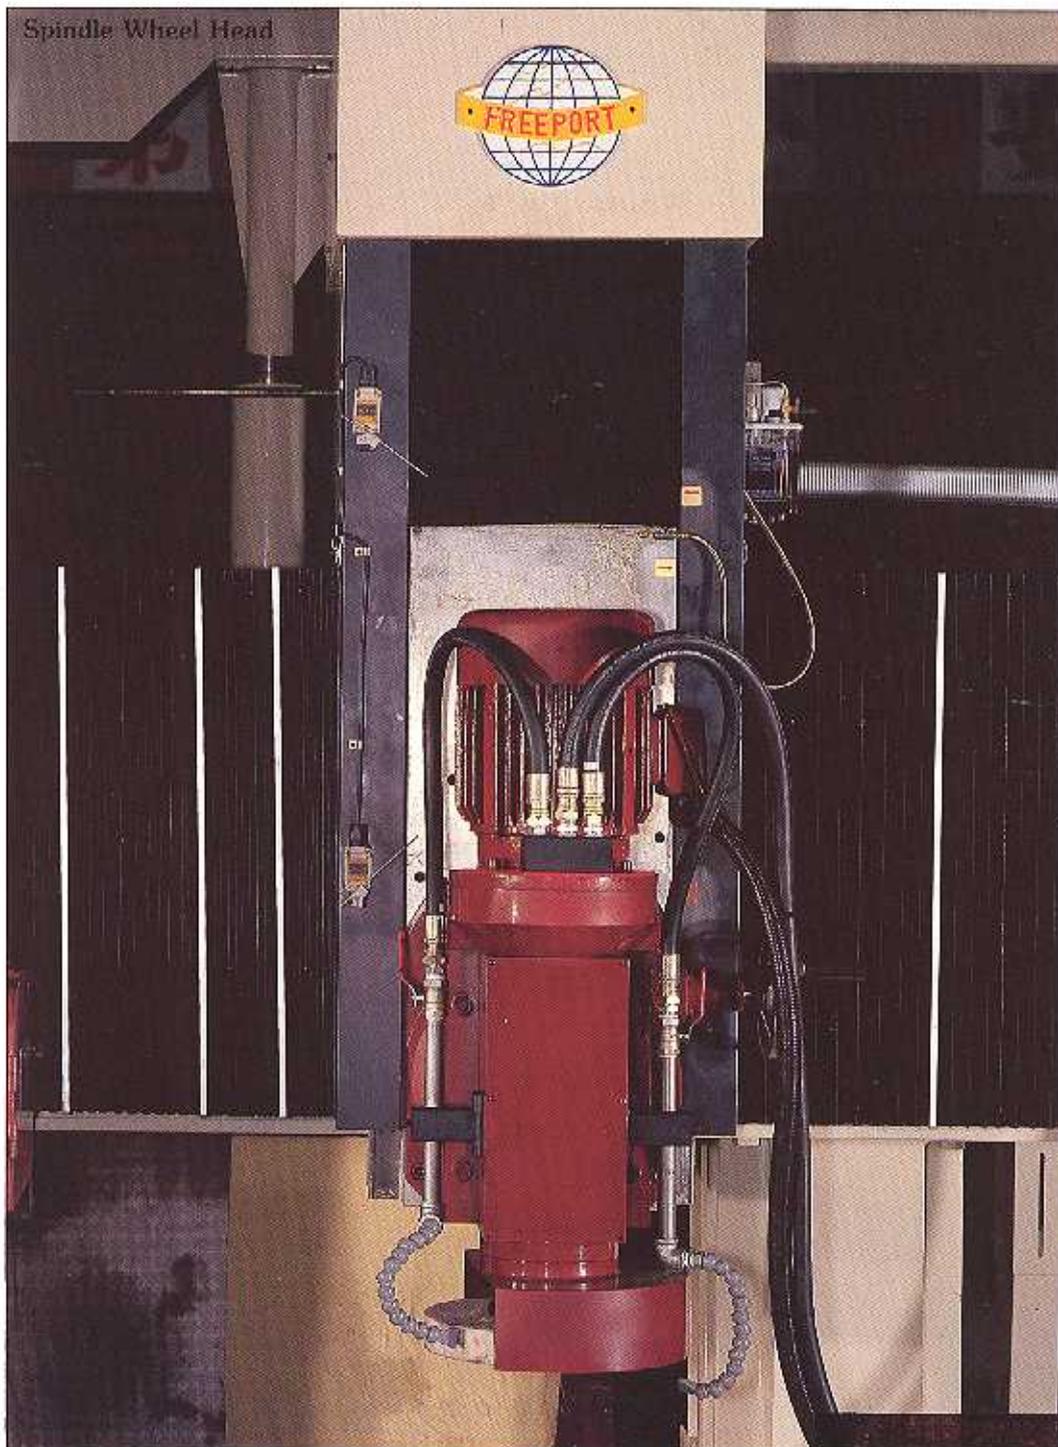

MACHINERY

HORIZONTAL GRINDING HEAD

- High precision and rigidity spindle uses preloaded super precision high speed ball bearings, and are completely sealed with high class grease. Even under heavy duty grinding, it still maintain quiet, high accuracy, and low temperature. Spindle taper runs out under 0.003mm T.I.R.

UNIVERSAL GRINDING HEAD

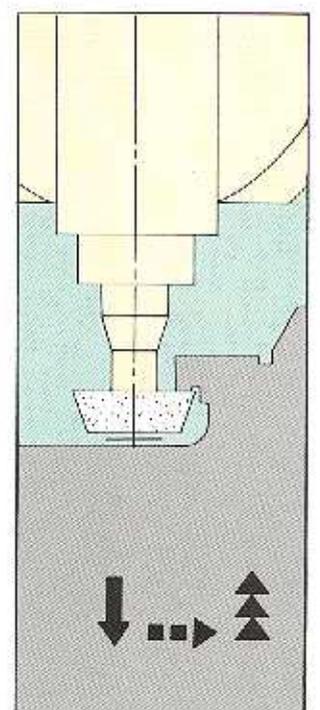

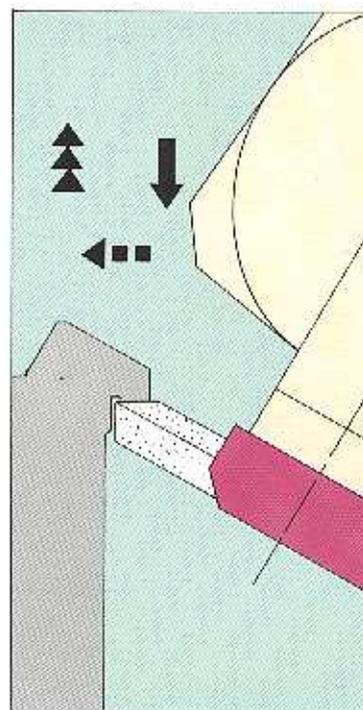

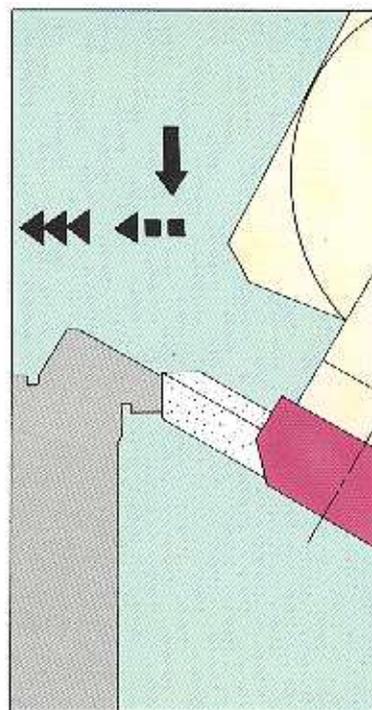

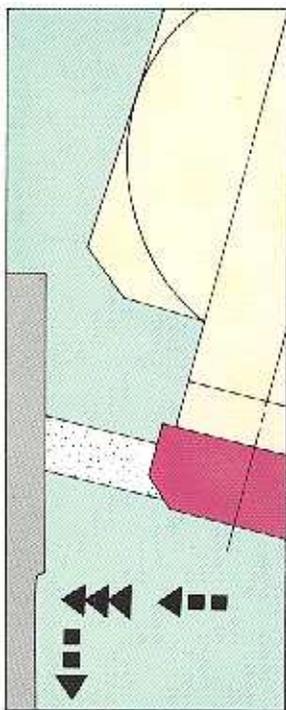

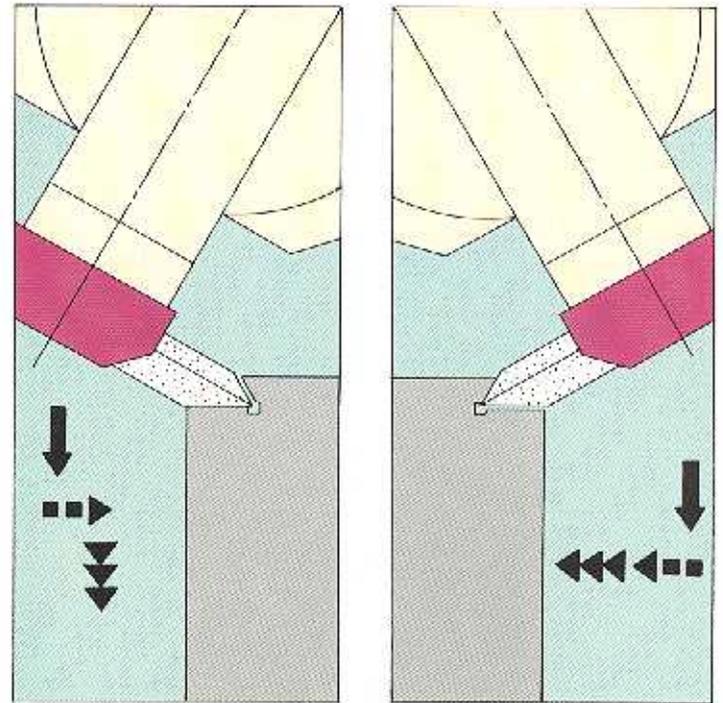

UNIVERSAL GRINDING HEAD

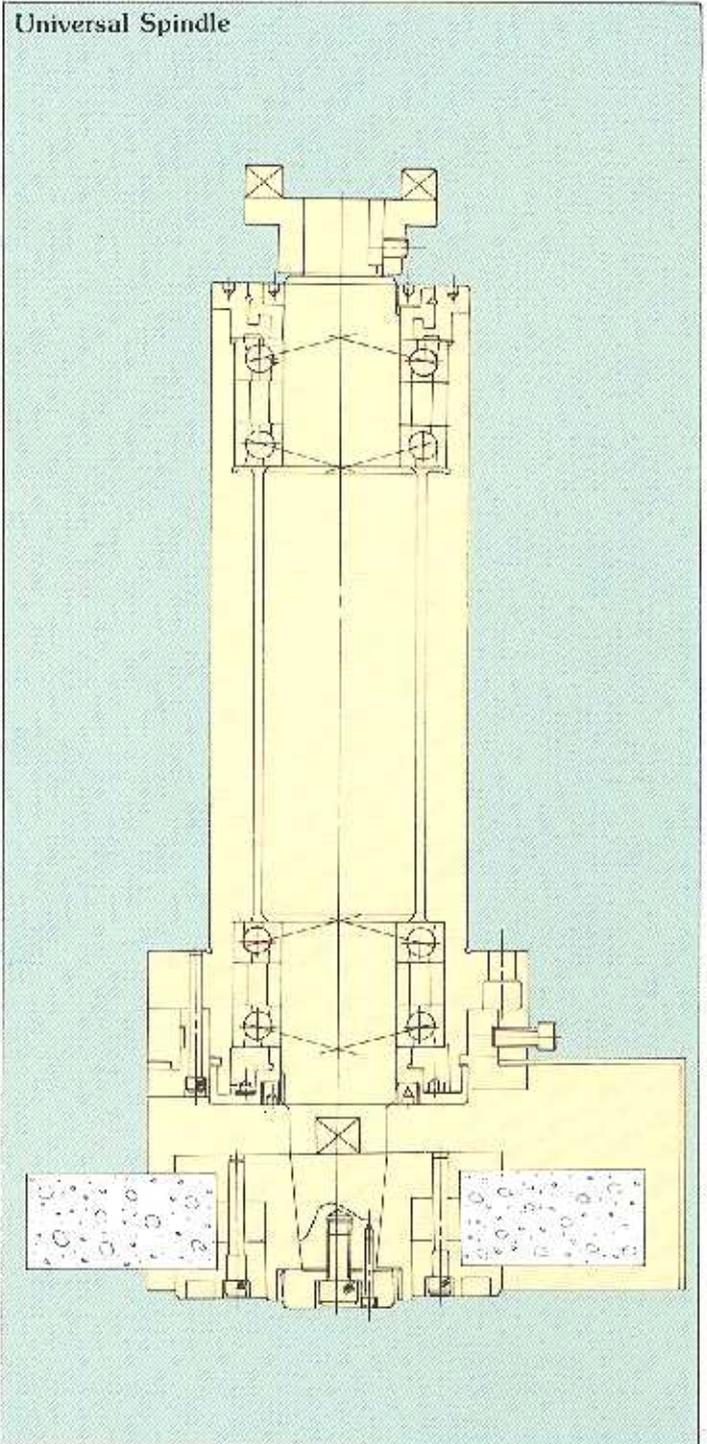

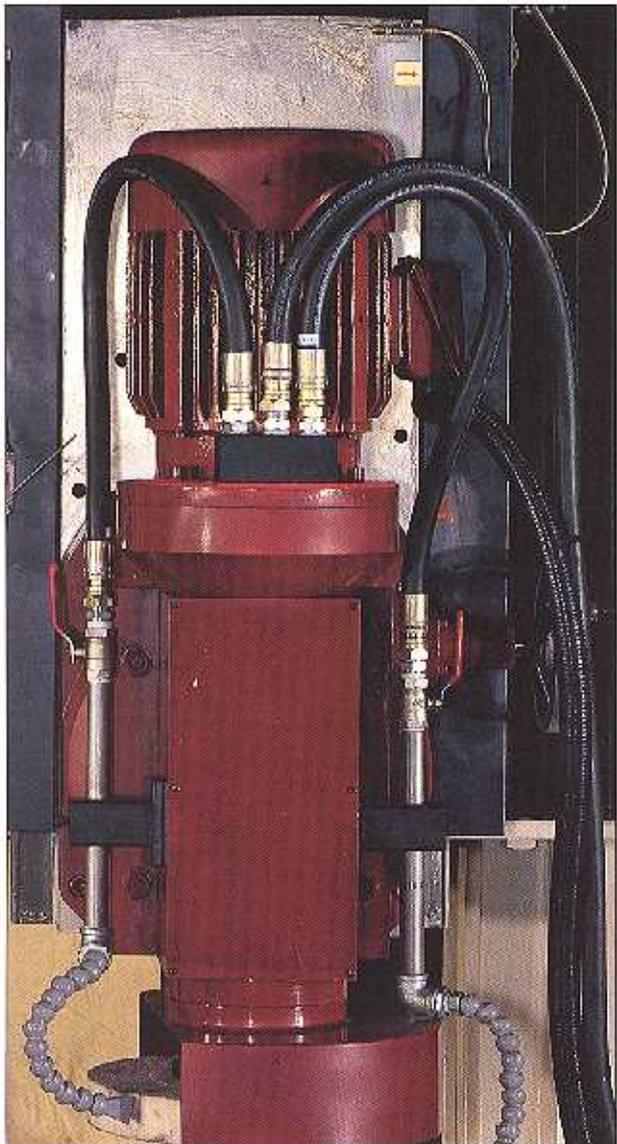

Operation Example Of Universal Grinding Head

- Angle swivel of universal axle wheel head is driven through lead screw and worm gear, it can swiftly turn wheel head within $\pm 90^\circ$, which is very convenient for forming grinding procession.
- Vertical feeding cooperates with cross movement of wheel head to achieve the surface and forming grinding, see diagram.

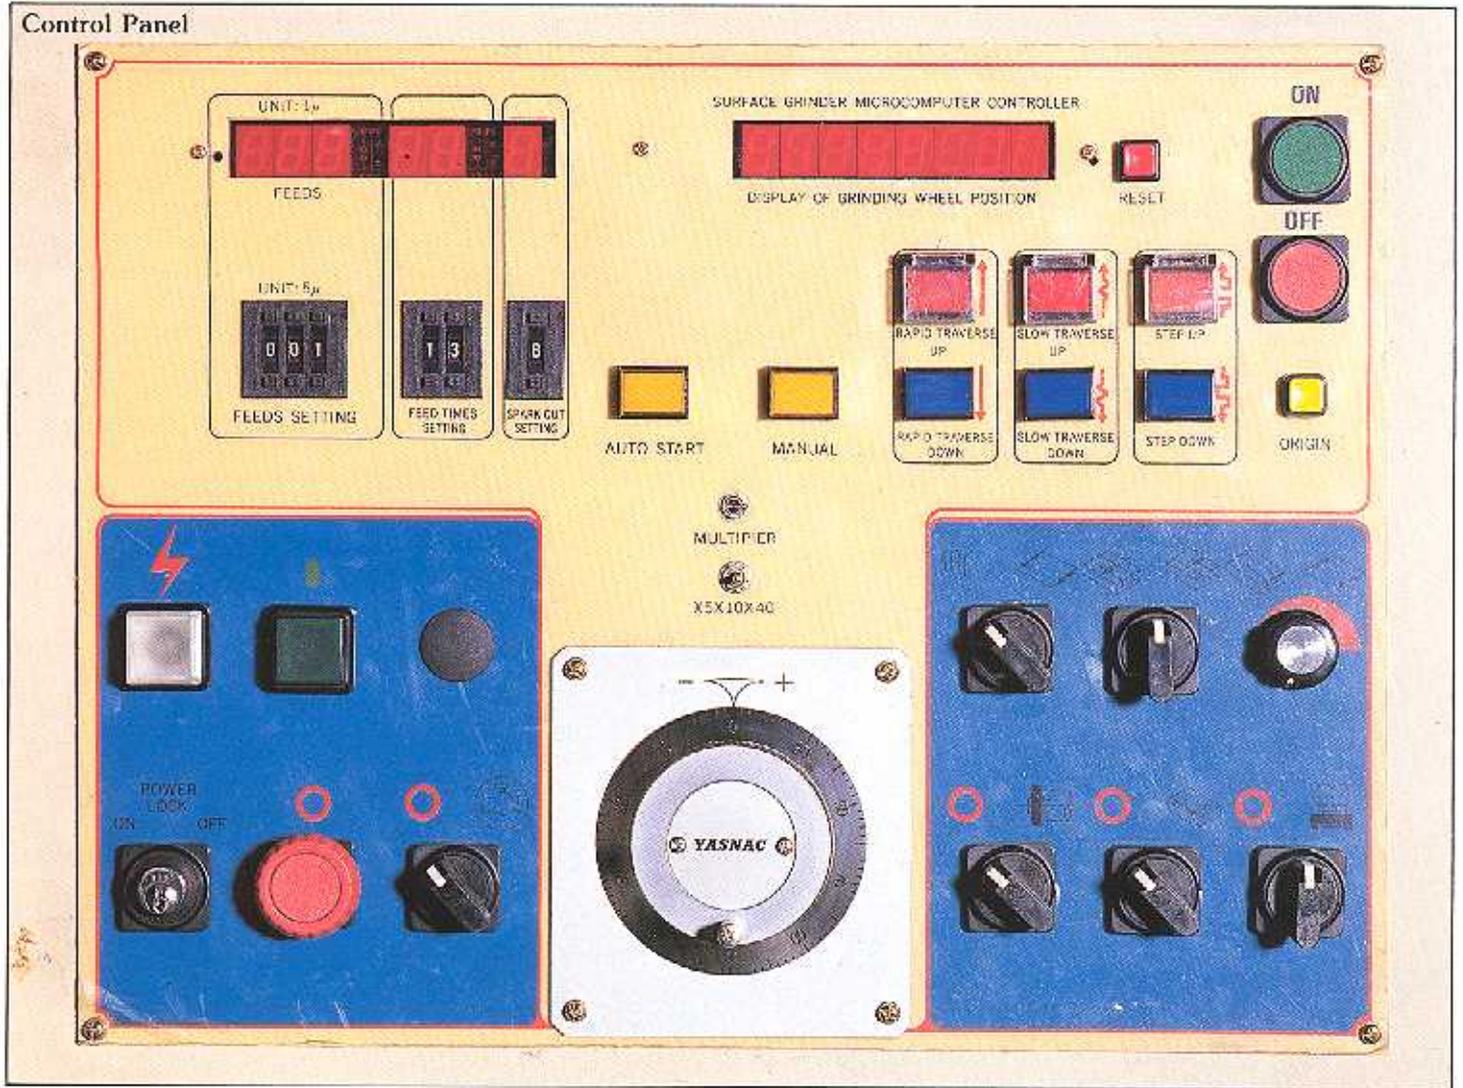

-  Rapid wheel head displacement
-  Automatic stepping cross feed
-  Automatic pulse feed

- V3 grade spindle motor and coupler had been correctly balanced, it ensures quiet and steady machining.

PENDANT CONTROL BOX

- The location of switches on control panel is designed for the best view and most convenient operation of the operator. Microcomputer and machinery power switches are separately lined up, there are two different colors to identify, each switch has simple graph on it to show its function; so that all control switches can be understood very easily.
- P.L.C. controller separates the machinery control circuit and microcomputer control circuit strictly, so that the microcomputer control circuit won't be interrupted by machinery power noise.
- The functions of microcomputer operation switches are designed into three parts. One is automatic feeding, the other is manual operation, another is pulse generator hand wheel operation.
- Automatic feeding: It can be set for (a) each feeding capacity (b) feeding times, can be set from 1 to 99 times. (c) spark out machining, can be set from 0 to 9 times.
- Manual operation: There are three sets push button to change the rapid, normal, and stepping up, down, forward, and backward feeding. (Stepping capacity is set by the automatic feeding capacity.)
- Hand wheel operation: Through triple speeds selected transmission of manual pulse generator, further ensures accuracy and easy operation.
